

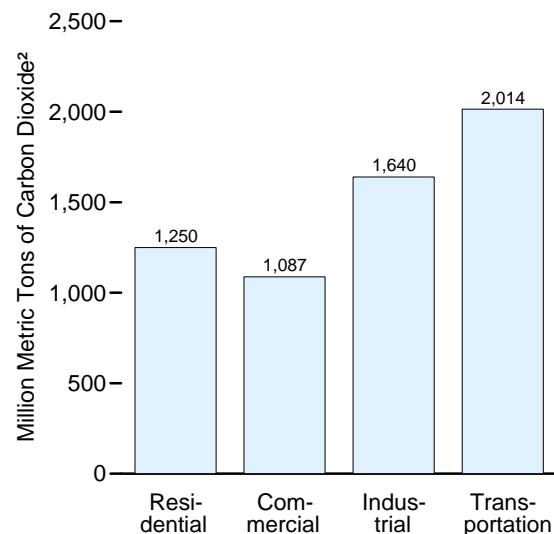

Figure 12.3 Carbon Dioxide Emissions From Energy Consumption by Sector by Energy Source, 2007

By End-Use Sector¹

Total by Fuel

By Petroleum Product

By End-Use Sector¹ and Source

¹ Emissions from energy consumption in the electric power sector are allocated to the end-use sectors in proportion to each sector's share of total electricity retail sales (see Table 8.9).

² Metric tons of carbon dioxide can be converted to metric tons of carbon equivalent by multiplying by 12/44.

³ Coal coke net imports, the plastics component of municipal solid waste, and geothermal.

⁴ Liquefied petroleum gases.

⁵ Aviation gasoline, lubricants, and other products.

⁶ Small amounts of coal consumed for transportation are reported as industrial consumption.

⁷ The industrial sector also includes 4 million metric tons of coal coke net imports.

Note: Because scales differ, graphs should not be compared
