

Weekly Petroleum Status Report

EIA DATA ARE AVAILABLE IN ELECTRONIC FORM

Tables 1 and 11-17 of the *Weekly Petroleum Status Report* (WPSR) in TXT and CSV formats, and Table 13 in DBF format are posted to the web site after 10:30 a.m. Eastern Time on Wednesdays. PDF files are posted to the web site after 1:00 p.m. on Wednesdays. For some weeks that include holidays, posting is delayed by one day. Customers who do not have access to the Internet may call the National Energy Information Center (NEIC) to request a single print-on-demand copy (a black and white bound printed document). To take advantage of this service, please call the NEIC at 202-586-8800 or email them at infoctr@eia.doe.gov. This service is provided free of charge for a single copy. Please note: NEIC will not accept or print multiple copy orders.

WPSR customers may also want to take a look at EIA's This Week in Petroleum (TWIP) web site (<http://tonto.eia.doe.gov/oog/info/twip/twip.asp>), which provides current market analysis and data for crude oil and major petroleum products. It is generally available at 1:00 p.m. Eastern Time on Wednesdays.

All current EIA publications are available on the EIA web site. Users can view and download selected pages or entire reports, search for information, download EIA data and analysis applications, and find out about new EIA information products and services:

World Wide Web: <http://www.eia.doe.gov>
FTP: <ftp://ftp.eia.doe.gov>

EIA also offers a **listserv** service for EIA press releases and other short documents. This service is also used to notify customers of new data and analysis products, changes to current products, and other news of interest. Sign up for one or more listservs by doing the following:

Logon to www.eia.doe.gov
On the left sidebar click on "Sign up for email Updates"
Simply follow the prompts

For further information, and for answers to questions on energy statistics, please contact EIA's National Energy Information Center at:

National Energy Information Center (NEIC)

9:00 a.m. to 4:00 p.m., Eastern Time, M-F
E-mail: infoctr@eia.doe.gov

Release Date: March 24, 2004

This report was prepared by the Energy Information Administration, the independent statistical and analytical agency within the U.S. Department of Energy. The information contained herein should be attributed to the Energy Information Administration and should not be construed as advocating or reflecting any policy position of the Department of Energy or any other organization.

Preface

The *Weekly Petroleum Status Report* (WPSR) provides timely information on supply and selected prices of crude oil and principal petroleum products in the context of historical data and forecasts. It serves the industry, the press, planners, policymakers, consumers, analysts, and State and local governments with a ready, reliable source of current information. The supply data contained in this report are based primarily on company submissions for the week ending 7:00 a.m. the preceding Friday. Weekly price data are collected as of 8:00 a.m. every Monday. The daily spot and futures prices are provided by Reuters, Inc. Data are released electronically after 10:30 a.m. each Wednesday, and hard copies of the publication are available for distribution on Thursday (on demand). For some weeks which include holidays, publication of the *WPSR* is delayed by one day.

General information about this document may be obtained from the National Energy Information Center (NEIC) (202) 586-8800, (202) 586-0727 (fax), and email: infoctr@eia.doe.gov.

This report is available on the World Wide Web at:

http://www.eia.doe.gov/oil_gas/petroleum/data_publications/weekly_petroleum_status_report/wpsr.html

¹ Difference is equal to volume for current month minus volume for previous month.

² Includes crude oil product supplied, natural gas liquids, liquefied refinery gases (LRG's), other liquids, and all finished petroleum products except finished motor gasoline, distillate fuel oil, residual fuel oil, and jet fuel.

³ Includes natural gas liquids, liquefied refinery gases (LRG's), other liquids, and all finished petroleum products except motor gasoline, jet fuel, distillate fuel oil, and residual fuel oil.

⁴ A negative number indicates a decrease in stocks and a positive number indicates an increase.

⁵ Crude oil stocks in the SPR include non-U.S. stocks held under foreign or commercial storage agreements.

⁶ Distillate fuel oil stocks located in the "Northeast Heating Oil Reserve" are not included.

Note: Totals may not equal sum of components due to independent rounding.

Highlights

U.S. crude oil refinery inputs averaged nearly 14.6 million barrels per day during the week ending March 19, up 109,000 barrels per day from the previous week's average. The region with the largest increase compared to the previous week is the Gulf Coast (PADD III).

U.S. crude oil imports averaged 10.1 million barrels per day last week, up 610,000 barrels per day from the previous week. Crude oil imports into the Gulf Coast (PADD III) increased by nearly 1.2 million barrels per day, and at nearly 6.9 million barrels per day, was the highest weekly average ever. Over the last four weeks, crude oil imports have averaged 9.8 million barrels per day. Although the origins of weekly crude oil imports are preliminary and thus not published, it appears that crude oil imports from Nigeria were extremely high last week. Total motor gasoline imports (including both finished gasoline and gasoline blending components) averaged 756,000 barrels per day last week, while distillate fuel imports averaged 385,000 barrels per day last week.

U.S. commercial crude oil inventories (excluding those in the Strategic Petroleum Reserve) grew by 7.5 million barrels last week. At 288.6 million barrels, U.S. crude oil inventories are currently 18.9 million barrels less than the 5-year average for this time of year. Motor gasoline inventories decreased by 0.1 million barrels last week, and are 8.5 million barrels below the 5-year average. Distillate fuel inventories fell by 1.4 million barrels, with a drop in high-sulfur (heating oil) more than compensating for a small increase in low-sulfur (diesel fuel) inventories. At 110.4 million barrels, distillate fuel inventories are 2.6 million barrels below the

5-year average for this time of year. Total commercial petroleum inventories are 42.1 million barrels less than the 5-year average.

Total product supplied over the last four-week period has averaged nearly 19.6 million barrels per day, or 1.9 percent less than averaged over the same period last year. Motor gasoline demand over the last four weeks has averaged 8.95 million barrels per day, or 4.4 percent above the same period last year. Distillate fuel demand is down 5.5 percent, while kerosene-type jet fuel demand is up 1.7 percent over the last four weeks compared to the same four-week period last year.

The average world crude oil price on March 19, 2004 was \$31.46, \$0.31 more than last week and \$4.28 above a year ago. WTI was \$38.09 per barrel on March 19, 2004, \$1.88 over last week and \$10.91 higher than last year. The spot price for conventional gasoline in the New York Harbor was 112.90 cents per gallon, 5.85 cents higher than last week and 32.80 cents over a year ago. The spot price for No. 2 low-sulfur diesel fuel in the New York Harbor was 98.70 cents per gallon, up 7.82 cents from last week and 17.45 cents above last year.

The national average retail regular gasoline price increased to 174.3 cents per gallon on March 22, 2004, 1.9 cents per gallon more than last week and 5.3 cents per gallon over a year ago. The national average retail diesel fuel price rose to 164.1 cents per gallon, 2.4 cents per gallon above last week but 2.1 cents per gallon less than a year ago.

Refinery Activity (Thousand Barrels per Day)

	Four Weeks Ending		
	03/19/04	03/12/04	03/19/03
Crude Oil Input to Refineries	14,608	14,578	14,734
Refinery Capacity Utilization (Percent)	88.3	88.1	89.4
Motor Gasoline Production	8,428	8,381	7,958
Distillate Fuel Oil Production	3,509	3,478	3,640

See Table 2.

Stocks (Million Barrels)

Cumulative daily averages will be shown beginning with the week ending April 9, 2004, issue when Petroleum Supply Monthly data for January 2004 become available.

¹ Includes lease condensate.

² Net Imports = Gross Imports (line 3) + Strategic Petroleum Reserve (SPR) Imports (line 4) - Exports (line 5).

³ Unaccounted-for Crude Oil is a balancing item. See Glossary for further explanation.

⁴ Includes field production of fuel ethanol and an adjustment for motor gasoline blending components.

⁵ Includes finished petroleum products, unfinished oils, gasoline blending components, and natural gas plant liquids.

⁶ Includes an estimate of minor product stock change based on monthly data.

⁷ Distillate fuel oil stocks located in the "Northeast Heating Oil Reserve" are not included. For details see Appendix B.

⁸ Includes crude oil product supplied, natural gas liquids, liquefied refinery gases (LRGs), other liquids, and all finished petroleum products except motor gasoline, jet fuels, distillate, and residual fuel oils.

⁹ Includes domestic and Customs-cleared foreign crude oil in transit to refineries.

¹⁰ Included are stocks of all other oils such as aviation gasoline, kerosene, natural gas liquids and LRGs, other hydrocarbons and oxygenates, aviation gasoline blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and miscellaneous oils.

¹¹ Crude oil stocks in the SPR include non-U.S. stocks held under foreign or commercial storage agreements.

Note: Some data are estimated. See Sources for clarification of estimated data. Due to independent rounding, individual product detail may not add to total. Sources: See page 30.

¹ Calculated as gross inputs divided by the latest reported monthly operable capacity. See Glossary. Percentages are calculated using unrounded numbers.

² Beginning in 1993, motor gasoline production and product supplied includes blending of fuel ethanol and an adjustment to correct for the imbalance of motor gasoline blending components.

Notes: Some data are estimated. See Sources for clarification of estimated data. Production statistics represent net production (i.e., refinery output minus refinery input).

Source: See page 30.

Figure 1. U.S. Refinery Capacity, Inputs, and Production, July 2002 to Present

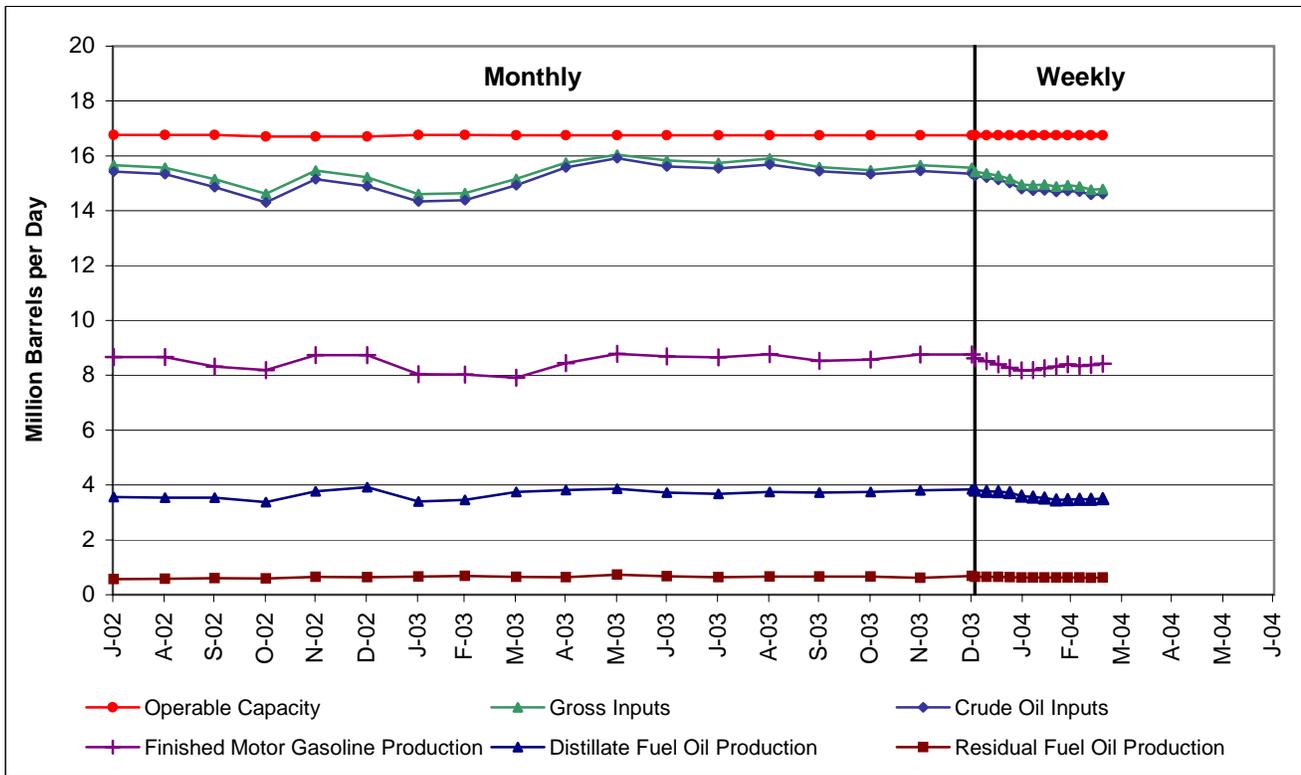

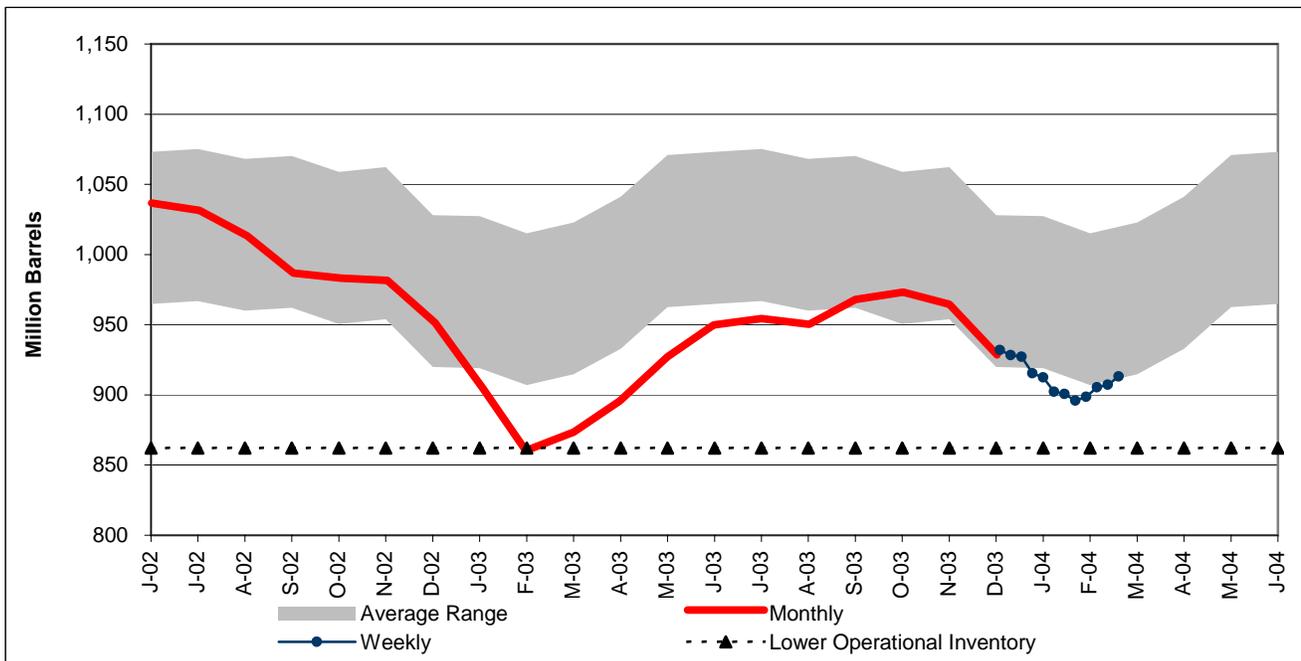

Figure 2. U.S. Stocks of Crude Oil and Petroleum Products, June 2002 to Present

Note: The Lower Operational Inventory for total stocks is 862.0 million barrels. See Appendix A for further explanation.

¹ Product stocks include those domestic and Customs-cleared foreign stocks held at, or in transit to, refineries and bulk terminals, and stocks in pipelines.

Stocks held at natural gas processing plants are included in "Other Oils" and in totals. All stock levels are as of the end of the period.

² Crude oil stocks include those domestic and Customs-cleared foreign crude oil stocks held at refineries, in pipelines, in lease tanks, and in transit to refineries.

Does not include those held in the Strategic Petroleum Reserve (SPR).

³ Distillate fuel oil stocks located in the "Northeast Heating Oil Reserve" are not included. For details see Appendix D.

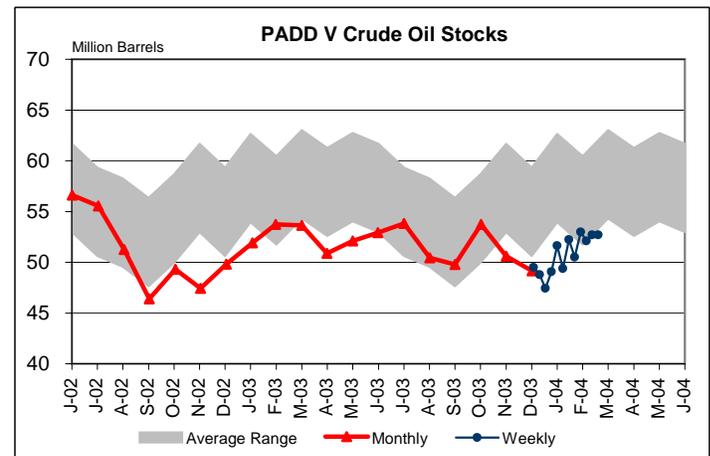

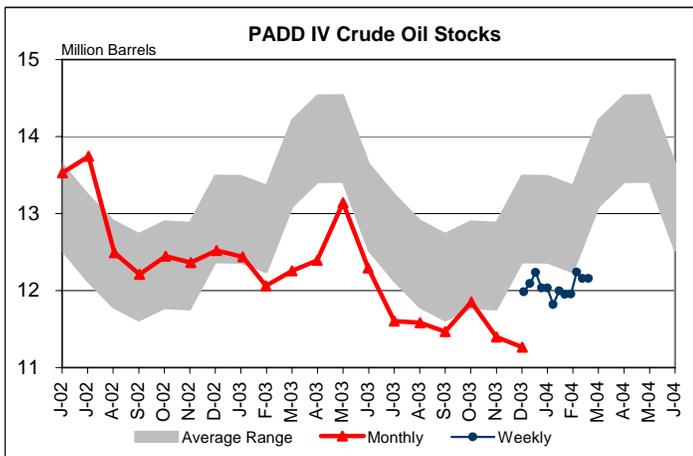

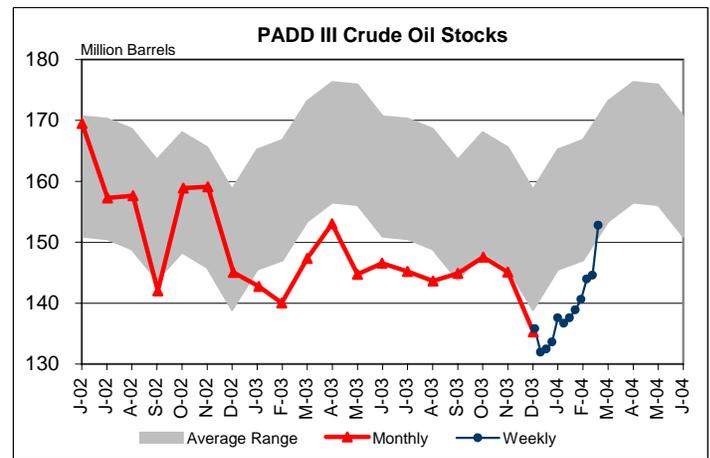

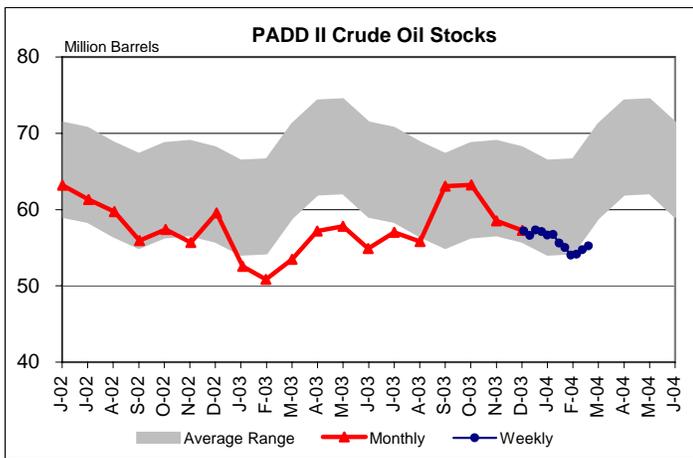

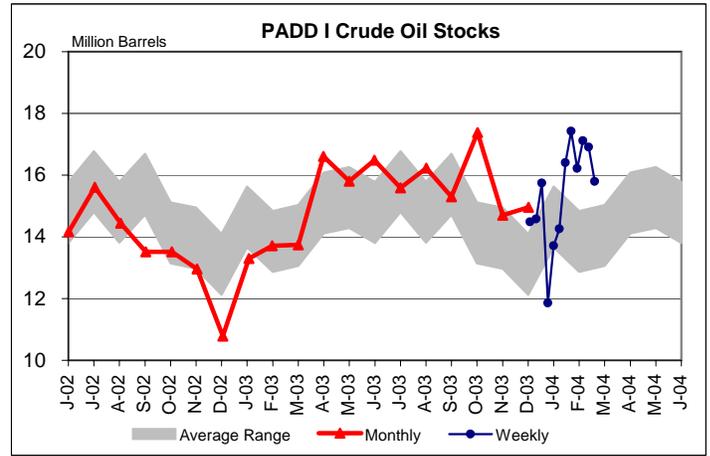

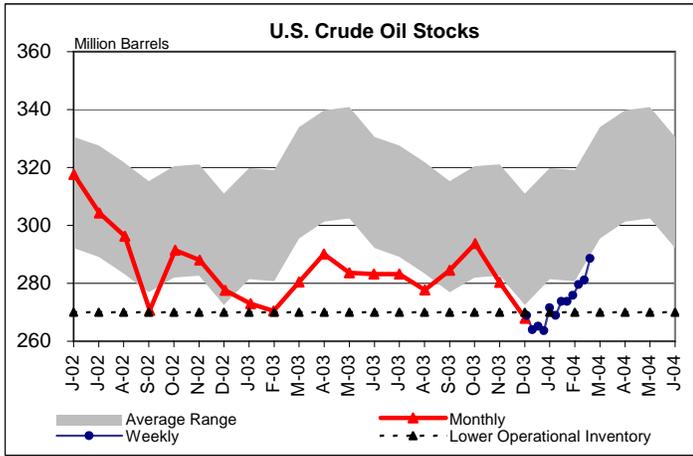

⁴ Included are stocks of all other oils such as aviation gasoline, kerosene, natural gas liquids and LRG's, other hydrocarbons and oxygenates, aviation gasoline blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and miscellaneous oils.

⁵ Crude oil stocks in the SPR include non-U.S. stocks held under foreign or commercial storage agreements.

Notes: Some data are estimates. See Sources for clarification of estimated data. Data may not add to total due to independent rounding.

Source: See page 30.

Figure 3. Stocks of Crude Oil by PAD District, June 2002 to Present

Note: The Lower Operational Inventory for crude oil stocks is 270.0 million barrels. See Appendix A for further explanation.

¹ Net production equals gross production minus input. Negative production will occur when the amount of product produced during the month is less than the amount of that same product reprocessed (input) or reclassified to become another product during the same month.

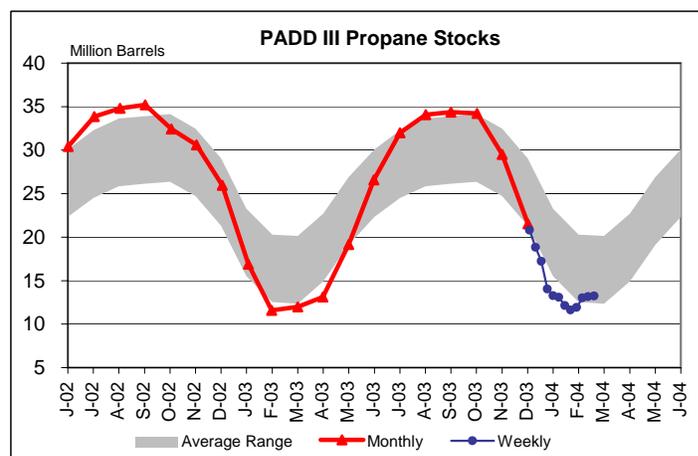

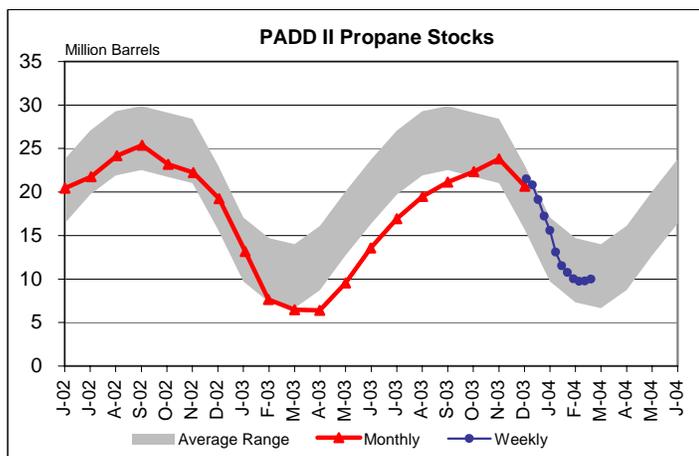

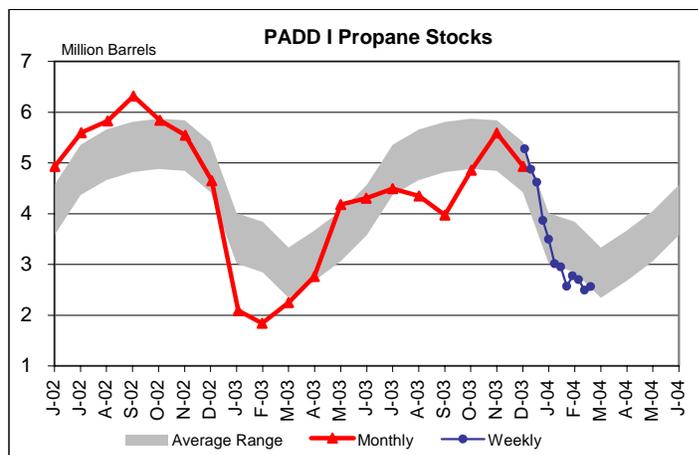

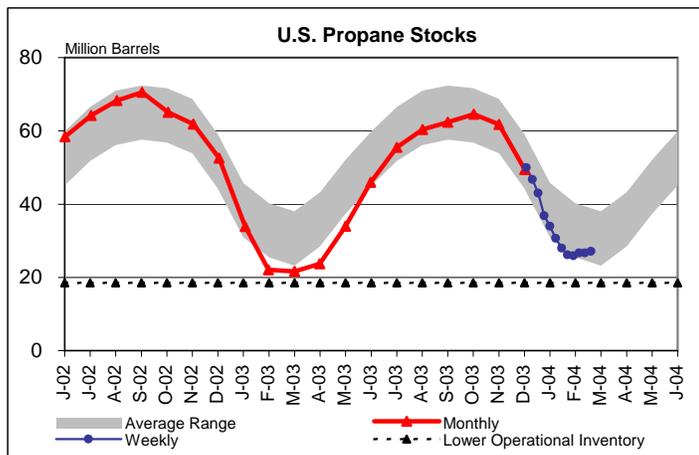

² Collection of weekly Propylene (Nonfuel use) inventory data began with week ending January 10, 2003.

NA=Not Available.

Notes: • This table presents weekly data, derived from a cut-off sample of refineries and fractionators that produce propane and from companies that import or store propane, which have been extrapolated to the universe of companies reporting in PADDs 1, 2, and 3. • Totals may not equal sum of components due to independent rounding. Propylene (Nonfuel use) data collected from bulk terminal facilities in PADDs 1, 2, and 3.

Source: Energy Information Administration (EIA), Monthly Petroleum Supply Reporting System and data collected on Form EIA-807, "Propane Telephone Survey." Magnitudes of revisions to monthly data are published in Appendix C of the Petroleum Supply Monthly.

Figure 7. Stocks of Propane by PAD Districts I, II, and III, June 2002 to Present

Note: The Lower Operational Inventory for propane stocks is 18.5 million barrels. See Appendix A for further explanation.

Total Stocks (Including SPR) ⁷	1,562.7	1,555.5	1,467.1	7.2	95.6	

Cumulative daily averages will be shown beginning with the week ending April 9, 2004, issue when Petroleum Supply Monthly data for January 2004 become available.

¹ Includes lease condensate.

² Net Imports = Gross Imports (line 3) + Strategic Petroleum Reserve (SPR) Imports (line 4) - Exports (line 5).

³ Unaccounted-for Crude Oil is a balancing item. See Glossary for further explanation.

⁴ Includes field production of fuel ethanol and an adjustment for motor gasoline blending components.

⁵ Includes finished petroleum products, unfinished oils, gasoline blending components, and natural gas plant liquids.

⁶ Includes an estimate of minor product stock change based on monthly data.

⁷ Distillate fuel oil stocks located in the "Northeast Heating Oil Reserve" are not included. For details see Appendix B.

⁸ Includes crude oil product supplied, natural gas liquids, liquefied refinery gases (LRGs), other liquids, and all finished petroleum products except motor gasoline, jet fuels, distillate, and residual fuel oils.

⁹ Includes domestic and Customs-cleared foreign crude oil in transit to refineries.

¹⁰ Included are stocks of all other oils such as aviation gasoline, kerosene, natural gas liquids and LRGs, other hydrocarbons and oxygenates, aviation gasoline blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and miscellaneous oils.

¹¹ Crude oil stocks in the SPR include non-U.S. stocks held under foreign or commercial storage agreements.

Notes: Some data are estimated. See Sources for clarification of estimated data. Due to independent rounding, individual product detail may not add to total. Sources: See page 30.

¹ Estimated contract prices based on government-selling prices, netback values, or spot market quotations. All prices are f.o.b. at the foreign port of lading except where noted; 30 day payment plan except where noted. See Appendix A for procedure used for calculation of world oil prices.

² An arbitrary scale expressing the gravity or density of liquid petroleum products.

³ Netback price at U.S. Gulf.

⁴ Average prices (f.o.b.) weighted by estimated export volume.

⁵ On 60 days credit.

⁶ Effective July 19, 1996, the Total Non-OPEC price reflects the decision by Gabon to leave the organization. Total OPEC prices from that date forward have been adjusted accordingly.

⁷ Brunei contract prices no longer available for use in weekly calculations.

⁸ Price (f.o.b.) to Mediterranean destinations; also called Urals.

⁹ Average prices (f.o.b.) weighted by estimated import volume.

Note: The Canadian crude prices have been changed to U.S. dollars.

NA=Not Applicable.

R=Revised data.

Source: See page 30.

Explanatory Notes

Survey Design And Estimation Methods

The data presented in this publication include data collected by the Petroleum Division (PD) on weekly and monthly surveys, and data released by Reuters Ltd. PD weekly supply data are derived from the Weekly Petroleum Supply Reporting System (WPSRS) which comprises five surveys: the “Weekly Refinery Report” (EIA-800); the “Weekly Bulk Terminal Report” (EIA-801); the “Weekly Product Pipeline Report” (EIA-802); the “Weekly Crude Oil Stocks Report” (EIA-803); and the “Weekly Imports Report” (EIA-804). The EIA weekly reporting system, as part of the Petroleum Supply Reporting System, was designed to collect data similar to those collected monthly. In the WPSRS, selected petroleum companies report weekly data to EIA on crude oil and petroleum product stocks, refinery inputs and production, and crude oil and petroleum product imports. On the Forms EIA-800 through EIA-803, companies report data on a custody basis. On the Form EIA-804, the importer of record reports each shipment entering the United States. Current weekly data and the most recent monthly data are used to estimate the published weekly totals.

PD price data contained in this report are derived from 2 weekly telephone surveys and 3 monthly mail surveys. The weekly surveys, EIA-878, “Motor Gasoline Price Survey,” and EIA-888, “On-Highway Diesel Fuel Price Survey,” provide timely information on national and regional retail prices of gasoline and on-highway diesel fuel. The monthly surveys collect volume weighted price data for crude oil and petroleum products, the EIA-14, “Refiners’ Monthly Cost Report,” EIA-782A, “Refiners’/Gas Plant Operators’ Monthly Petroleum Product Sales Report,” and EIA-782B, “Resellers’/Retailers’ Monthly Petroleum Product Sales Report.” In order to provide a comprehensive summary of current conditions in petroleum markets, spot and futures prices as reported by Reuters Ltd. are also included.

Sample Frame

WPSRS Forms: EIA-800 through EIA-804

The sample of companies that report weekly in the WPSRS was selected from the universe of companies that report monthly. All sampled companies report data only for facilities in the 50 States and the District of Columbia. The frame from which the EIA-800 sample is drawn includes all operating and idle petroleum refineries and blending plants in the 50 States and the District of Columbia. The EIA-801 sample frame includes all bulk terminal facilities in the United States and its possessions that have total bulk storage capacity of 50,000 barrels or more, or that receive

petroleum products by tanker, barge, or pipeline. The EIA-802 sample frame includes all petroleum product pipeline companies in the 50 States and the District of Columbia that transport refined petroleum products, including interstate, intrastate, and intracompany pipeline movements. Pipeline companies that transport only natural gas liquids are not included in the EIA-802 frame. Only those pipeline companies which transport products covered in the weekly survey are included. The EIA-803 sample frame consists of all companies which carry or store 1,000 barrels or more of crude oil. Included are gathering and trunk pipeline companies (including interstate, intrastate and intracompany pipelines), crude oil producers, terminal operators, storers of crude oil, and companies transporting Alaskan crude oil by water in the 50 States and the District of Columbia. The frame from which the EIA-804 sample is drawn includes importers of record of crude oil and petroleum products into the 50 States and the District of Columbia including imports of petroleum products from Puerto Rico, the Virgin Islands, and other U.S. possessions.

Sampling Designs

The sampling procedure used for the surveys in the WPSRS is the cut-off method. In the cut-off method, companies are ranked from largest to smallest on the basis of the quantities reported during some previous period. Companies are chosen for the sample beginning with the largest and adding companies until the total sample covers about 90 percent of the total for each item and each geographic region for which weekly data are published.

	Weekly Form	Dec. 2003 Frame Size	Weekly Sample Size
Refiners (Refineries)	EIA-800	258(411)	74(258)
Bulk Terminals	EIA-801	247	70
Product Pipelines	EIA-802	80	40
Crude Oil Stock Holders	EIA-803	146	59
Importers	EIA-804	171	81

The geographic areas were defined as (a) the 24 States in which No. 2 distillate was a significant heating source and 50 States and the District of Columbia for residual and motor gasoline, (b) the 25 States in which propane was a significant energy source, or as (c) the PAD Districts for districts where not all State estimates are provided. The type-of-sale classifications were retail and resale for motor gasoline and residual fuel oil, and residential and

nonresidential retail and wholesale for distillate and propane. Four volume-of-sales strata (certainty, zero, low, and high) were defined with volume boundaries differing by State, sales type, and product.

The EIA-878 telephone survey collects price data from a selected sample of 912 retail gasoline outlets. The sample of outlets was designed to yield price estimates for national, PADD, and subdistrict PADD levels of ozone nonattainment and attainment areas, and select cities and states with a 1 cent standard error. Weekly sampling errors may vary from this target. The sample was derived by selecting companies with a probability proportional to size, based on their retail sales of gasoline reported on the EIA-782 monthly survey from November 1996 to October 1997. Once a company was selected, it was contacted to determine the location for each outlet randomly sampled within the outlets owned by the company. Using this location information, outlets were classified by the two fuel formulations. The number of outlets selected within each PADD varied according to expected price variances in each PADD and estimated distributions of outlets.

The EIA-888 telephone survey collects price data from a selected sample of 350 retail on-highway diesel fuel outlets. The sample for the survey was designed to yield price estimates at the PADD, sub-PADD and national level, and for the state of California. A 1 cent standard error was targeted for PADDs 1, 2 and 3, and 1.5 cents for PADDs 4, 5, sub-PADDs 1X, 1Y, 1Z, and the state of California. Standard errors for determining the sample size were estimated using data from the EIA-888 survey. The EIA-888 sample was derived as a probability proportional to size subsample of the respondents from the EIA-782A and EIA-782B sample who reported on-highway diesel fuel sales where the reported volume was the company size. Specific outlets within a company were selected using probability proportional to size sampling according to data provided by the company when initiated to the survey.

Collection Methods

Survey data for the WPSRS are collected by mail, mailgram, telephone, Telex, facsimile, and electronic transmission on a weekly basis. All canvassed firms must file by 5:00 p.m. on the Monday following the close of the report week, 7:00 a.m. Friday. During the processing week, company corrections of the prior week's data are also entered. Survey data are collected weekly by telephone and facsimile for the EIA-878 and EIA-888. It is mandatory for each monthly respondent to submit completed forms to EIA no later than 30 calendar days after the close of each reference month. For the EIA-878 and EIA-888 surveys, data are mostly collected through a Computer Assisted Telephone Interview (CATI) survey processing system on Monday of each week as of 8:00 a.m. local time. If Monday is a holiday, the calls are made on the next business day, however, the Monday price is recorded.

Data Processing

Data collected through WPSRS are received, logged into an automated Survey Control File, keyed and processed through an

edit program. Data that fail the edits are resolved through telephone calls to the respondents. Statistical reports, including publication tables, are generated using only acceptable and verified data. Imputation is performed for nonrespondents and for data that fail the edits. Data from the EIA-878 and EIA-888 telephone surveys are received over the telephone and entered on-line at collection time by the interviewer and edited.

Estimation And Imputation

Survey data gathered from the respondents invariably contain incomplete reporting, nonresponse, and values that fail editing. Imputation for nonrespondents in the WPSRS data base is performed after the company reports have been checked and entered into the system. The imputed values are exponentially smoothed means of recent weekly reported values for this specific company. The imputed values are treated like reported values in the estimation procedure, which calculates ratio estimates of the weekly totals. First, the current week's data for a given product reported by companies in a geographic region are summed. (Call this weekly sum, W_s .) Next, the most recent month's data for the product reported by those same companies are summed. (Call this monthly sum, M_s .) Finally, let M_t be the sum of most recent month's data for the product as reported by all companies. Then, the current week's ratio estimate for that product for all companies, W_t , is given by:

$$W_t = \frac{M_t}{M_s} \cdot W_s$$

This procedure is used directly to estimate total weekly inputs to refineries and production. To estimate stocks of finished products, the preceding procedure is followed separately for refineries, bulk terminals, and pipelines. Total estimates are formed by summing over establishment types.

Weekly imports data are highly variable on a company-by-company basis or a week-by-week basis. Therefore, an exponentially smoothed ratio has been developed. The estimate of total weekly imports is the product of the smoothed ratio and the sum of the weekly reported values and imputed values.

EIA-878 outlet prices are weighted by the estimated volume per outlet for each formulation and grade of gasoline, and by PADD. EIA-888 outlet prices have a constant weight within a PADD, sub-PADD and the state of California. Average prices are weighted by their respective volume percent of the U.S. volume of retail on-highway diesel fuel sales to derive the national average price.

Response Rates

The response rate at the close of business on the filing deadline day is about 80 percent for the EIA-800, 75 percent for the EIA-801, 95 percent for the EIA-802, 80 percent for the EIA-803, and greater than 95 percent for the EIA-804. However, more forms are received the next day, bringing the final response rates up. Late respondents are contacted by telephone. Nearly all of the major

companies report on time. The response rate for the published estimates is usually between 98 percent and 100 percent.

The response rates on Forms EIA-878, and EIA-888 are usually 98 to 100 percent.

Reliability Of Data

There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. Sampling errors occur because observations are made only on a sample, not on the entire population. Non-sampling errors can be attributed to many sources in the collection and processing of data. The accuracy of survey results is determined by the joint effects of sampling and nonsampling errors.

Measures Of Sampling Variability

Tables showing data from the EIA-878, and EIA-888 surveys utilize a sample of resellers and retailers and, therefore, have sampling error. The particular sample used for each of the EIA-878, and EIA-888 surveys is one of a large number of all possible samples that could have been selected using the same design. Estimates derived from the different possible samples would differ from each other. The average of these estimates would be close to the estimate derived from a complete enumeration of the population (a census), assuming that a complete enumeration has the same nonsampling errors as the sample survey. The sampling error, or standard error of the estimate, is a measure of the variability among the estimates from all possible samples of the same size and design and, thus, is a measure of the precision with which an estimate from a particular sample approximates the results of a complete enumeration.

Nonsampling Errors

Nonsampling errors can be attributed to many sources such as incorrect reporting by respondents, mistakes in recording or coding the data, and other errors of collection, response, coverage, and estimation for missing data.

Confidentiality

The data contained in this publication are subject to statistical nondisclosure procedures. The objective of the disclosure-avoidance procedures, as stated in the Energy Information Administration Standard 88-05-06, Subject: "Nondisclosure of Company Identifiable Data in Aggregate Cells," is to ensure that confidential, company-identifiable data are not disclosed in tables where "company specific responses may be proprietary and prohibited from public disclosure by 18 U.S.C. 1905." Statistics representing data aggregated from fewer than three companies or that are dominated by input from one or two companies are withheld. EIA identifies cells that are sensitive according to these criteria by applying a statistical formula to the data contained in each cell to determine if a few companies "dominate" the cell. If a cell is sensitive, the data in that cell are suppressed and a "W" is placed in the publication cell. Also, since many tables include row or column totals, some nonsensitive data cells have been suppressed to prevent the reader from calculating

the suppressed numbers by simply subtracting the published numbers from the total.

Estimation Of Domestic Crude Oil Production

Monthly data on crude oil production for States are reported to the Department of Energy by State conservation agencies. Data on the volume of crude oil produced on Federally-owned offshore leases are reported by the Minerals Management Service, U.S. Department of the Interior. There is a time lag of approximately 4 months between the end of the reporting month and the time when the monthly crude oil production information becomes available. In order to present more timely crude oil production volumes, the Energy Information Administration prepares weekly crude oil production estimates which are based on historical production patterns and, where available, other data such as pipeline runs from the Alaskan North Slope during the week. These weekly estimates are presented as the weekly and 4-week average crude oil production volumes shown in this publication. Cumulative crude oil production volumes shown in the U.S. Petroleum Balance Sheet include revised estimates published in the *Petroleum Supply Monthly*.

Estimation Of Exports

Official U.S. exports statistics for crude oil and petroleum products are compiled by the U.S. Bureau of the Census and are published in the *Petroleum Supply Monthly*. The EIA obtains these data on a monthly basis approximately 10 weeks after the close of the reporting month. Beginning with statistics for the first week ending in October 1991, weekly estimates of exports are forecast using an autoregressive integrated moving-average (ARIMA) procedure. The ARIMA procedure models a value as a linear combination of its own past values and present and past values of other related time series. The most recent 5 years of past data are used to obtain the exports forecast. In addition, for the major products and crude oil, 5 years of related price data are used. The price data include some U.S. and some foreign series. Because of the reduction in volume of crude oil exports, and a shift in the country distribution, a new model was implemented on November 2, 2001 to determine the expected volume of crude oil exports.

Estimation Of Other Oils Stocks

Data are derived by (1) computing an average daily rate of stock change for the minor products for each month based on monthly data for the past 6 years; (2) using this daily rate and the minor stock levels from the most recent monthly publication to estimate the minor product stock level for the current period. Year ago data are interpolated from published monthly stock levels.

Initial Estimates of Petroleum Prices

The initial estimates are forecasts of U.S. and PADD prices for crude oil and selected petroleum products published in the *Petroleum Marketing Monthly* (PMM) (See Table IE1). The initial estimates are published 1-2 months ahead of the normal publication schedule for the *PMM*. The initial estimates are forecasted using an autoregressive integrated moving average (ARIMA) transfer function model. The initial estimate is

calculated based on its own past values and present and past values of other related time series, such as spot prices and heating degree-days. At least 5 years of data are used to obtain the forecasts.

One method of forecast evaluation is to compare actual to one month ahead forecast values for a 12 month period. Then, the Average Absolute Differences (AAD) are calculated. This provides a good indicator of the error associated with the forecasts. For the period January 1997 to December 1998, the forecasted values were within 2 cents of the actual value for 85% of the petroleum products and within 30 cents of the actual value for all the crude oil forecasts.

Data Assessment

The principal objective of the Petroleum Supply Reporting System is to provide an accurate picture of petroleum industry activities and of the availability of petroleum products nationwide from primary distribution channels. The weekly data, which are based on sample estimates stemming largely from preliminary company data, serve as leading indicators of the monthly data. The weekly data are not expected to have the same level of accuracy as the preliminary monthly data when compared with final monthly data. However, the weekly data are expected to exhibit like trends and product flows characteristic of the preliminary and final monthly data.

To assess the accuracy of weekly statistics, monthly estimates derived from weekly estimates are compared with the final monthly aggregates published in the *Petroleum Supply Annual*. Although final monthly data are still subject to error, they have been thoroughly reviewed and edited, they reflect all revisions made during the year and they are considered to be the most accurate data available. The mean absolute percent error provides a measure of the average revisions relative to the aggregates being measured for a variable. The mean absolute percent error for 2002 weekly data was less than 2 percent for 27 of the 61 major petroleum variables analyzed. Many of the variables with mean absolute percent errors of 2 percent or more were for refined products imports series. The mean absolute percent error for total weekly refined products imports was 5.17 percent for 2002. It should be noted that products imports data are highly variable and cannot be estimated from a sample with the same precision as other petroleum variables. Weekly estimates for refined products imports are almost always low because small companies, which are not in the weekly sample, generally import large volumes of finished products only a few times during the year.

An analytical article, "Accuracy of Petroleum Supply Data," which assesses the differences between preliminary and final data on the 61 major petroleum variables, is published in the *Petroleum Supply Monthly* once each year.

Interpretation And Derivation Of Average Inventory Levels

The national inventory (stocks) graphs for total petroleum products, crude oil, motor gasoline, distillate fuel oil, and residual fuel oil in this publication include features to assist in comparing current inventory levels with past inventory levels and with judgments of critical levels. Methods used in developing the average inventory levels and lower operational inventory are described below.

Average Inventory Levels

The graphs displaying inventory levels of crude oil and petroleum products (p.4), crude oil (p.6), motor gasoline (p.8), distillate fuel oil (p.10), residual fuel oil (p.12), and propane (p.14) provide the reader with actual inventory data compared to an "average range" for the most recent 5-year period running from January through December or from July through June. The ranges also reflect seasonal variation for the past 7 years. The seasonal factors, which determine the shape of the upper and lower curves, are estimated with a seasonal adjustment technique developed at the Bureau of Census (Census X-11). The seasonal factors are assumed to be stable (i.e., the same seasonal factor is used for each January during the 7-year period) and additive (i.e., the series is deseasonalized by subtracting the seasonal factor for the appropriate month from the reported inventory levels). The intent of deseasonalization is to remove only annual variation from the data. Thus, deseasonalized series would contain the same trends, cyclical components, and irregularities as the original data. The seasonal factors are updated annually in October, using the 7 most recent years' final monthly data. The seasonal factors are used to deseasonalize data from the most recent 5-year period (January-December or July-June) in order to determine a deseasonalized average band. The average of the deseasonalized 36-month series is the midpoint of the band, and two standard deviations of the series (adjusting first for extreme points) is its width. When the seasonal factors are added back in (the upper curve is the midpoint plus one standard deviation plus the seasonal factor, and the lower curve is the midpoint minus one standard deviation plus the seasonal factor), the "average range" shown on the graphs reflects the actual data. The ranges are updated every 6 months in April and October (Table A1).

Lower Operational Inventory

The lines labeled "lower operational inventory" on the stock graphs are the lower end of the demonstrated operational inventory range updated for known and definable changes in the petroleum delivery system.

Calculation of World Oil Price

The weighted average international price of oil, shown in the "Highlights" on page 1 and on page 24, is an average calculated using specific crude oil prices weighted by the estimated crude oil export volume for each oil-producing country. To develop the table shown on page 24, a list of major oil producing/exporting countries was chosen. For each country, the contract selling price

of one or more representative crude oils was determined by investigating a number of industry publications (i.e., "Oil Buyers' Guide", "Platt's Oilgram Price Report", "Petroleum Intelligence Weekly", and "Weekly Petroleum Argus") and by contacting oil market analysts. Then, the appropriate crude oil volumes to be used as weighting factors for each country were determined. These volumes are estimates based on a number of sources which provide data on production, consumption, and exports for these countries. Export volumes for a number of smaller producing/exporting countries, not listed in the table, are included in the weighting factors. After the export volumes had been determined, simple mathematical weighted averages were calculated to arrive at the "Total OPEC," "Total Non-OPEC," and "Total World" prices. The average United States (FOB) import price is derived by the same basic procedure as the world oil price, that is, taking the representative contract crude oil price of a specific crude oil from a particular country and weighting this price by a certain volume of crude oil. In this case, the weighting factors are the volumes of crude oil imported into the U.S. from pertinent countries. Import volumes from a number of smaller producing/exporting countries, not listed in the table, are included in the weighting factors.

Both the import and export volumes are preliminary. Due to their origin, these estimates cannot be fully verified. These volumes are updated monthly, or more frequently when changes in oil market conditions make updating appropriate.

Form EIA-807 Propane Survey

The Form EIA-807, "Propane Telephone Survey," was implemented in April 1990 as the result of the 1989 propane supply disruption. The hardships experienced by propane users during the December 1989 cold-snap in the Northeast and Mid-Continent areas made the need for timely supply information imperative. During 1990, propane data was collected and provided to Congress and others upon request.

Respondent Frame

The sample of companies that report monthly is selected from the universe of respondents that report on the monthly surveys listed below:

Form Number	Name
EIA-810	<i>Monthly Refinery Report</i>
EIA-811	<i>Monthly Bulk Terminal Report</i>
EIA-812	<i>Monthly Product Pipeline Report</i>
EIA-816	<i>Monthly Natural Gas Liquids Report</i>

Sampling

The sampling procedure used for the EIA-807 is the cut-off method. In the cut-off method, facilities are ranked from largest to smallest on the basis of quantities reported for propane production, imports, and stocks. Companies are chosen for the sample

beginning with the largest and adding companies until the total sample covers about 90 percent of the total for each item and each geographic region (Petroleum Administration for Defense Districts I (IA, IB, IC), II and III) for which data are published. A bench mark factor is used to capture the remaining 10 percent of the propane industry.

The sample frame for the EIA-807 is re-evaluated on an annual basis to assure 90 percent coverage of the total for each item collected and each geographic region. However, when necessary the sample frame is updated more frequently.

Collection Methods

Data are collected by telephone or facsimile. No written confirmation of the data submission is necessary. For monthly data collections, telephone calls to respondents start on the third working day following the end of the report period.

Resubmissions

Resubmissions are any changes to the originally submitted data that were either requested by the EIA or initiated by the respondent. A determination is made on whether to process the resubmissions based on the magnitude of the revision. Cell entries on publication tables are marked with an "R" for revised.

Estimation and Imputation

After the company reports have been checked and entered into the EIA-807 data base, imputation is done for companies which have not yet responded. The imputed values are equal to the latest reported data for a particular reporting unit. Response rates are over 90 percent so very little imputation is done.

After the data files have been edited and corrected, aggregation is done for each geographic region. Estimation factors, derived similarly to those described on page 32, are then applied to each cell to generate published data.

Response Rate

The response rate is generally 95 to 100 percent. Chronic nonrespondents and late filing respondents are contacted by telephone and reminded of their requirement to report. Nearly all of the major companies report on time. The nonresponse rate for the published estimate is usually between 1 percent and 2 percent.

Propane Figures

The national and PADD level inventory (stocks) graphs include features to assist in comparing current inventory levels with past inventory levels and with judgements of critical levels. Figures C7 through C10 provide the reader with actual inventory data compared to an "average range" for the most recent 5-year period running from January through December or from July through June. The ranges also reflect seasonal variation for the past seven years. See page 34 for a further discussion.

Technical Notes

Note 1

The spot prices that are shown in Tables 14 and 15 are calculated by taking an unweighted average of the daily closing spot prices for a given product over a specified time period, such as a week or month.

Note 2

The futures prices shown in Table 16 are the official daily closing prices at 2:30 p.m. from the trading floor of the New York Mercantile Exchange (NYMEX) for a specific delivery month for each product listed in Table 16.

Note 3

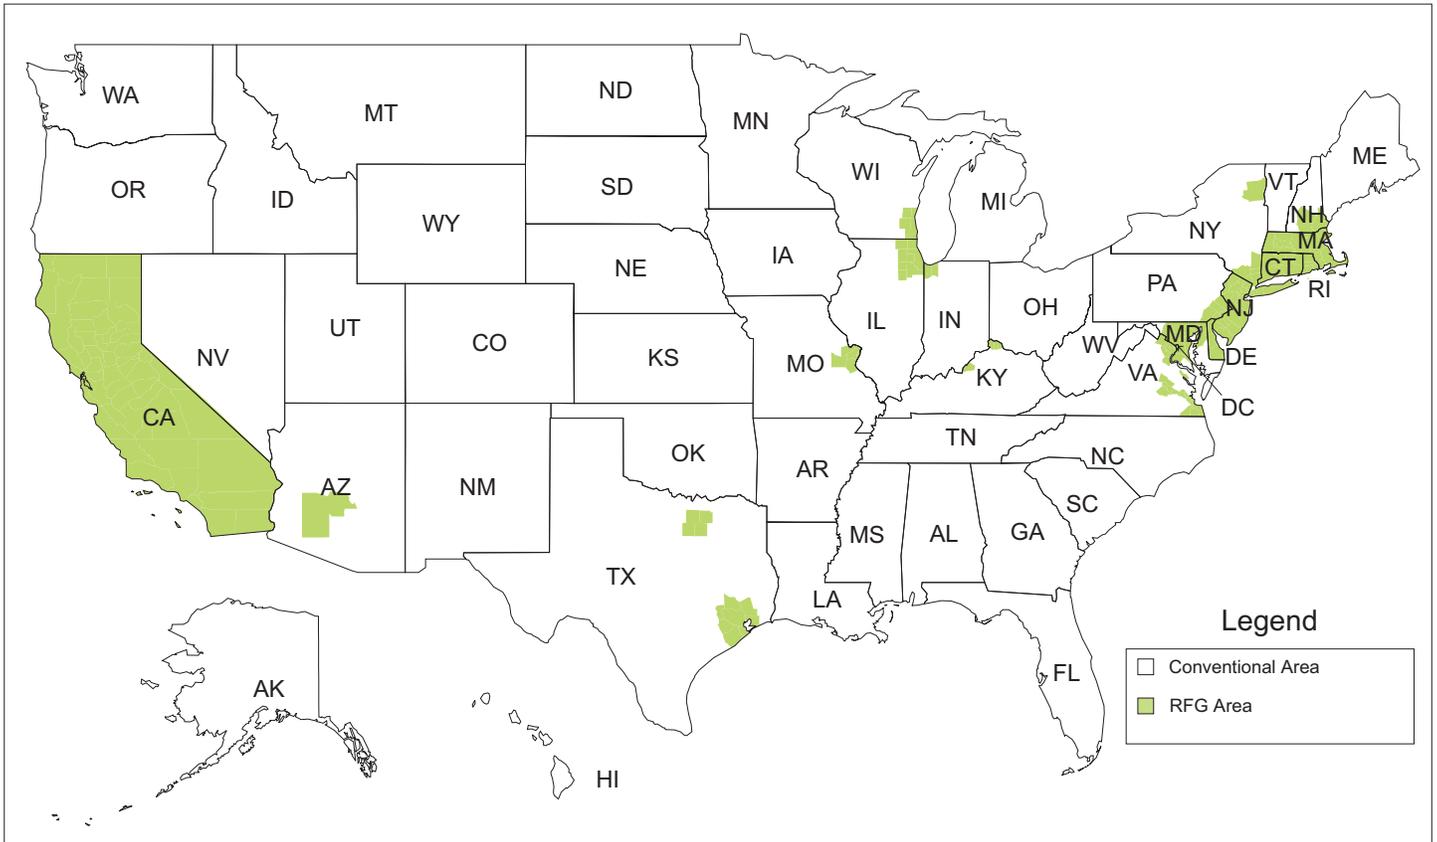

The futures price differentials shown in Figure 13 show the market premium for the first NYMEX delivery month contract over the second. For example, the data for September show the difference

between October and November futures contract prices for crude oil and petroleum products, indicating the relative values placed by markets on commodities to be delivered during those two months. This differential, if negative and large enough, provides incentive for refiners and traders to hold product in storage, and if positive, to defer purchases until some future point in time.

Note 4

The retail gasoline prices shown in Table 17 reflect sales of reformulated gasoline (RFG) in those areas where required by Federal or State law, and conventional gasoline elsewhere (see Figure A1). Areas requiring RFG may change over time due to the ozone non-attainment status of an area being re-designated by the Environmental Protection Agency (EPA), a State opting in or out of an EPA clean fuel program, or a State adopting its own specific clean fuel program. EIA reclassifies the outlets reporting retail gasoline prices each time an area shifts in or out of a reformulated gasoline program. "Conventional areas" in this instance include areas where oxygenated gasoline may be required for all or part of the year.

Appendix B

Northeast Heating Oil Reserve

On July 10, 2000, President Clinton directed the Department of Energy to establish the Northeast Heating Oil Reserve. The reserve is intended to reduce the risks presented by home heating oil shortages, such as the ones experienced in December 1996 and January-February 2000.

Maximum inventory of heating oil in the reserve will be two million barrels. The Department of Energy believes that a two-million-barrel reserve will provide relief from weather-related shortages for approximately ten days, which is the time for ships to bring heating oil from the Gulf of Mexico to New York Harbor. Inventory for the reserve was acquired by exchanging crude oil from the Strategic Petroleum Reserve for heating oil to be delivered to the storage facilities.

For more information on the Northeast Heating Oil Reserve, please contact Mr. Nathan Harvey from the Office of Petroleum Reserves at (202) 586-4734.

Northeast Heating Oil Reserve inventories classified as "Distillate Fuel Oil - Greater than 0.05 percent sulfur" are not considered to be in the commercial sector and therefore are excluded from distillate fuel oil supply and disposition statistics in Energy Information Administration publications, such as the *Weekly Petroleum Status Report*, *Petroleum Supply Monthly*, and "This Week In Petroleum."

Northeast Heating Oil Reserve (Thousand Barrels)

Terminal Operator	Location	Week Ending March 5, 2004

Glossary

Following are definitions taken from the Master List of the Petroleum Supply Division, plus definitions and/or explanations of terms used in the publication of the Weekly Petroleum Status Report (WPSR) that differ from those in the Master List. Terms used in the publication of data from the "EIA-819M Monthly Oxygenate Telephone Report" which becomes Appendix B in the WPSR are included. In addition, terms used by the Petroleum Marketing Division to collect and describe data on crude oil and petroleum product price and marketing activity are provided. Slight variations in the application of common terms used by both the Petroleum Supply and the Petroleum Marketing Divisions are in italics.

API Gravity. An arbitrary scale expressing the gravity or density of liquid petroleum products. The measuring scale is calibrated in terms of degrees API; it is calculated as follows:

$$\text{Degrees API} = \frac{141.5}{\text{sp. gr. } 60^{\circ} F / 60^{\circ} F} - 131.5$$

ASTM. American Society for Testing and Materials.

Barrel. A unit of volume equal to 42 U.S. gallons.

Blending Components, Gasoline. See Motor Gasoline Blending Components.

Blending Plant. A facility which has no refining capacity but is either capable of producing finished motor gasoline through mechanical blending or blends oxygenates into motor gasoline.

Bulk Station. A facility used primarily for the storage and/or marketing of petroleum products which has a total bulk storage capacity of less than 50,000 barrels and receives its petroleum products by tank car or truck.

Bulk Terminal. A facility used primarily for the storage and/or marketing of petroleum products which has a total bulk storage capacity of 50,000 barrels or more and/or receives petroleum products by tanker, barge, or pipeline.

CIF (Cost, Insurance, Freight). This term refers to a type of sale in which the buyer of the product agrees to pay a unit price that includes the Free On Board (FOB) value of the product at the point of origin plus all costs of insurance and transportation. This type of transaction differs from a "Delivered" purchase in that the buyer accepts the quantity as determined at the loading port (as certified in the Bill of Lading and Quality Report) rather than pay based on the quantity and quality ascertained at the unloading port. It is similar to the terms of an FOB sale except that the seller, as a service for which he is compensated, arranges for transportation and insurance.

Cooling Degree-Days. The number of degrees per day the daily average temperature is above 65 degrees F. The daily average temperature is the mean of the maximum and minimum temperature for a 24-hour period.

Conventional Area. Any area not requiring the sale of either reformulated gasoline or oxygenated fuels program reformulated gasoline (OPRG). *Note:* Includes oxygenated gasoline.

Conventional Gasoline: Finished motor gasoline not included in the oxygenated or reformulated gasoline categories. *Note:* This category excludes reformulated gasoline blendstock for oxygenate blending (RBOB) as well as other blendstock

Crude Oil: A mixture of hydrocarbons that exists in liquid phase in natural underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Depending upon the characteristics of the crude stream, it may also include:

Small amounts of hydrocarbons that exist in gaseous phase in natural underground reservoirs but are liquid at atmospheric pressure after being recovered from oil well (casinghead) gas in lease separators and are subsequently commingled with the crude stream without being separately measured. Lease condensate recovered as a liquid from natural gas wells in lease or field separation facilities and later mixed into the crude stream is also included;

Small amounts of nonhydrocarbons produced with the oil, such as sulfur and various metals;

Drip gases, and liquid hydrocarbons produced from tar sands, gilsonite, and oil shale.

Liquids produced at natural gas processing plants, topped crude oil (residual) and other unfinished oils are excluded. Crude oil is refined to produce a wide array of petroleum products, including heating oils; gasoline, diesel and jet fuels; lubricants; asphalt; ethane, propane, and butane; and many other products used for their energy or chemical content.

Crude Oil Input. The total crude oil put into processing units at refineries.

Degree-Day Normals. Simple arithmetic averages of monthly or annual degree-days over a long period of time (usually the 30-year period 1961-1990). This may be simple degree-day normals or population-weighted degree-day normals.

Delivery Month. The calendar month in a futures contract in which the commodity will be delivered. The First Delivery month available at any given time is one month in the future, e.g., on September 15, the First Delivery month futures contract is October, the Second Delivery month is November, etc. On the New York Mercantile Exchange (NYMEX), crude oil contract trading terminates at the close of business on the third business day prior to the 25th calendar day of the month preceding the delivery month, while petroleum product contracts expire on the last business day of the month preceding delivery.

Distillate Fuel Oil. A general classification for one of the petroleum fractions produced in conventional distillation operations. It is used primarily for space heating, on- and

off-highway diesel engine fuel (including railroad engine fuel and fuel for agricultural machinery), and electric power generation. Included are products known as No. 1, No. 2, and No. 4 fuel oils, and No. 1, No. 2, and No. 4 diesel fuels. Distillate fuel oil is reported by two sulfur categories:

0.05% sulfur and under, for use in on-highway diesel engines which could be described as meeting EPA regulations.

Greater than 0.05% sulfur, for use in all other distillate applications.

EPA. United States Environmental Protection Agency.

Expired. Refers to the status of a futures contract when the expiration date has passed and trading for that contract terminates. For example, trading on the New York Mercantile Exchange terminates for crude oil futures contracts at the close of business on the third business day prior to the 25th calendar day of the month preceding the delivery month, while trading terminates for petroleum product contracts on the last business day of the month preceding delivery.

Exports. Shipments of goods from within the 50 States and the District of Columbia to U.S. possessions and territories or to any foreign country.

Field Production. Represents crude oil production on leases, natural gas liquids production at natural gas processing plants, new supply of other hydrocarbons/oxygenates and motor gasoline blending components, and fuel ethanol blended into finished motor gasoline.

FOB (Free On Board). Pertains to a transaction whereby the seller makes the product available within an agreed on period at a given port at a given price; it is the responsibility of the buyer to arrange for the transportation and insurance.

Fuel Ethanol (C₂H₅OH). An anhydrous denatured aliphatic alcohol intended for gasoline blending as described in the Oxygenates definition.

Futures Price. The price quoted for delivering a specified quantity of a commodity at a specified time and place in the future.

Gasoil. European designation for No. 2 fuel oil, and No. 2 diesel fuel.

Gasohol. A blend of finished motor gasoline containing alcohol (generally ethanol but sometimes methanol) at a concentration of 10 percent or less by volume. Data on gasohol that has at least 2.7 percent oxygen, by weight, and is intended for sale inside carbon monoxide nonattainment areas are included in data on oxygenated gasoline. See Oxygenates.

Gasoline: See Motor Gasoline (Finished).

Gasoline Grades: The classification of gasoline by octane ratings. Each type of gasoline (conventional, oxygenated, and reformulated) is classified by three grades -Regular, Midgrade, and Premium. *Note:* Gasoline sales are reported by grade in

accordance with their classification at the time of sale. In general, automotive octane requirements are lower at high altitudes. Therefore, in some areas of the United States, such as the Rocky Mountain States, the octane ratings for the gasoline grades may be 2 or more octane points lower. Octane requirements may vary by altitude.

Regular Gasoline: Gasoline having an antiknock index, i.e., octane rating, greater than or equal to 85 and less than 88.

Midgrade Gasoline: Gasoline having an antiknock index, i.e., octane rating, greater than or equal to 88 and less than or equal to 90.

Premium Gasoline: Gasoline having an antiknock index, i.e., octane rating, greater than 90.

Gross Inputs. The crude oil, unfinished oils, and natural gas plant liquids put into atmospheric crude oil distillation units.

Heating Degree-Days. A measure of how cold a location is over a period of time relative to a base temperature, most commonly specified as 65 degrees Fahrenheit. The measure is computed for each day by subtracting the average of the day's high and low temperatures from the base temperature (65 degrees), with negative values set equal to zero. Each day's heating degree-days are summed to create a heating degree-day measure for a specified reference period. Heating degree-days are used in energy analysis as an indicator of space heating energy requirements or use.

Imports. Receipts of goods into the 50 States and the District of Columbia from U.S. possessions and territories or from any foreign country.

Jet Fuel. Includes Kerosene-type (Commercial or Military) and Naphtha-type.

Kerosene-type Jet Fuel: A kerosene-based product having a maximum distillation temperature of 400 degrees Fahrenheit at the 10-percent recovery point and a final maximum boiling point of 572 degrees Fahrenheit and meeting ASTM Specification D 1655 and Military Specifications MIL-T-5624P and MIL-T-83133D (Grades JP-5 and JP-8). It is used for commercial and military turbojet and turboprop aircraft engines.

Commercial: Kerosene-type jet fuel intended for commercial use.

Military: Kerosene-type jet fuel intended for military use.

Naphtha-type Jet Fuel: A fuel in the heavy naphtha boiling range having an average gravity of 52.8 degrees API, 20 to 90 percent distillation temperatures of 290 degrees to 470 degrees Fahrenheit, and meeting Military Specification MIL-T-5624L (Grade JP-4). It is used primarily for military turbojet and turboprop aircraft engines because it has a lower freeze point than other aviation fuels and meets engine requirements at high altitudes and speeds.

Lease Condensate. A natural gas liquid recovered from gas well gas (associated and non-associated) in lease separators or natural gas field facilities. Lease condensate consists primarily of pentanes and heavier hydrocarbons.

Liquefied Petroleum Gases (LPG). Ethane, ethylene, propane, propylene, normal butane, butylene, isobutane, and isobutylene produced at refineries or natural gas processing plants, including plants that fractionate raw natural gas plant liquids.

Liquefied Refinery Gases (LRG). Liquefied petroleum gases fractionated from refinery or still gases. Through compression and/or refrigeration, they are retained in the liquid state. The reported categories are ethane/ethylene, propane/propylene, normal butane/butylene, and isobutane/isobutylene. Excludes still gas.

Lower Operational Inventory (LOI). The lower operational inventory is the lower end of the demonstrated operational inventory range updated for known and definable changes in the petroleum delivery system. While not implying shortages, operational problems, or price increases, the LOI is indicative of a situation where inventory-related supply flexibility could be constrained or nonexistent. The significance of these constraints depends on local refinery capability to meet demand and the availability and deliverability of products from other regions or foreign sources.

Motor Gasoline (Finished). A complex mixture of relatively volatile hydrocarbons with or without small quantities of additives, blended to form a fuel suitable for use in spark-ignition engines. Motor gasoline, as defined in ASTM Specification D 4814 or Federal Specification VV-G-1690C, is characterized as having a boiling range of 122 to 158 degrees Fahrenheit at the 10 percent recovery point to 365 to 374 degrees Fahrenheit at the 90 percent recovery point. "Motor Gasoline" includes conventional gasoline; all types of oxygenated gasoline, including gasohol; and reformulated gasoline, but excludes aviation gasoline. *Note:* Volumetric data on blending components, such as oxygenates, are not counted in data on finished motor gasoline until the blending components are blended into the gasoline.

Reformulated Gasoline (RFG): Finished motor gasoline formulated for use in motor vehicles, the composition and properties of which meet the requirements of the reformulated gasoline regulations promulgated by the EPA under Section 211(k) of the Clean Air Act. *Note:* This category includes oxygenated fuels program reformulated gasoline (OPRG) but excludes reformulated gasoline blendstock for oxygenate blending (RBOB).

OPRG. "Oxygenated Fuels Program Reformulated Gasoline" is reformulated gasoline which is intended for use in an oxygenated fuels program control area during an oxygenated fuels program control period.

Price data are reported for areas required to sell specific types of motor gasoline.

Conventional Area: Any area not requiring the sale of either oxygenated gasoline, reformulated gasoline, or oxygenated fuels program reformulated gasoline.

Reformulated Area: Ozone nonattainment area designated by the EPA which requires the use of reformulated gasoline. *Note:* Includes oxygenated fuels program reformulated gasoline (OPRG).

Motor Gasoline Blending. Mechanical mixing of motor gasoline blending components, and oxygenates when required, to produce finished motor gasoline. Finished motor gasoline may be further mixed with other motor gasoline blending components or oxygenates, resulting in increased volumes of finished motor gasoline and/or changes in the formulation of finished motor gasoline (e.g., conventional motor gasoline mixed with MTBE to produce oxygenated motor gasoline).

Motor Gasoline Blending Components. Naphthas (e.g., straight-run gasoline, alkylate, reformat, benzene, toluene, xylene) used for blending or compounding into finished motor gasoline. These components include reformulated gasoline blendstock for oxygenate blending (RBOB) but exclude oxygenates (alcohols, ethers), butane, and pentanes plus. *Note:* Oxygenates are reported as individual components and are included in the total for other hydrocarbons, hydrogens, and oxygenates.

Motor Gasoline Price, Retail. See Technical Note 4.

MTBE (Methyl Tertiary Butyl Ether) [(CH₃)₃COCH₃.] An ether intended for gasoline blending as described in the Oxygenates definition.

Naphtha-type Jet Fuel. See Jet Fuel.

Natural Gas Liquids (NGL). Natural gas liquids recovered from natural gas in processing plants, and in some situations, from natural gas field facilities. Natural gas liquids extracted by fractionators are also included. These liquids are defined according to the published specifications of the Gas Processors Association and the ASTM and are classified as follows: ethane/ethylene, propane/propylene, normal butane/butylene, isobutane/isobutylene, and pentanes plus.

Net Production. Petroleum products produced at a refinery, natural gas processing plant, or blending plant. Published production equals production minus input. Negative production will occur when the amount of a product produced during the reporting period is less than the amount of that same product that is reprocessed (input) or reclassified to become another product during the same reporting period.

No. 2 Distillate. A petroleum distillate which meets the specifications for No. 2 heating or fuel oil as defined in ASTM D396 and/or the specifications for No. 2 diesel fuel as defined in ASTM Specification D975.

No. 2 Fuel Oil (Heating Oil). A distillate fuel oil for use in atomizing type burners for domestic heating or for medium capacity commercial-industrial burner units, with distillation temperatures between 540-640 degrees

Fahrenheit at the 90-percent recovery point; and the kinematic viscosities between 1.9-3.4 centistokes at 100 degrees Fahrenheit as defined in ASTM Specification D396 -92.

No. 2 Diesel Fuel. A gasoil type distillate for use in high speed diesel engines generally operated under uniform speed and load conditions, with distillation temperatures between 540-640 degrees Fahrenheit at the 90-percent recovery point; and the kinematic viscosities between 1.9-4.1 centistokes at 100 degrees Fahrenheit as defined in ASTM specification D975 - 93. Includes Type R-R diesel fuel used for railroad locomotive engines, and Type T-T for diesel-engine trucks.

For pricing data, **Low Sulfur** or **On-Highway Diesel Fuel** is No. 2 diesel fuel which has a sulfur level less than or equal to 0.05 percent by weight. **High Sulfur** refers to No. 2 distillate fuel (either diesel or fuel oil) which has a sulfur level greater than 0.05 percent by weight.

Nonattainment Area. Any area that does not meet the national primary or secondary ambient air quality standard established by the Environmental Protection Agency for designated pollutants, such as carbon monoxide and ozone.

NYMEX. The New York Mercantile Exchange.

Octane Rating: A number used to indicate gasoline's antiknock performance in motor vehicle engines. The two recognized laboratory engine test methods for determining the antiknock rating, i.e., octane rating, of gasolines are the Research method and the Motor method. To provide a single number as guidance to the consumer, the antiknock index $(R + M)/2$, which is the average of the Research and Motor octane numbers, was developed.

Operable Capacity. See Percent Utilization.

Operating Capacity. See Percent Utilization.

OPRG Area. See Motor Gasoline (Finished).

Other Finished. See Conventional Gasoline.

Other Oils. Includes aviation gasoline, kerosene, natural gas liquids, LRGs, other hydrocarbons and oxygenates, aviation gasoline blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and miscellaneous oils.

Oxygenated Area. See Motor Gasoline (Finished).

Oxygenated Gasoline. Finished motor gasoline, other than reformulated gasoline, having an oxygen content of 2.7 percent or higher by weight. Includes gasohol. *Note:* Oxygenated gasoline excludes oxygenated fuels program reformulated gasoline (OPRG) and reformulated gasoline blendstock for oxygenate blending (RBOB).

Oxygenates. Substances which, when added to gasoline, increase the amount of oxygen in that gasoline blend. Ethanol, Methyl Tertiary Butyl Ether (MTBE), Ethyl Tertiary Butyl Ether (ETBE), and methanol are common oxygenates. They include:

Fuel Ethanol: Blends of up to 10 percent by volume anhydrous ethanol.

MTBE (Methyl Tertiary Butyl Ether): Blends of up to 15.0 percent by volume MTBE which must meet the ASTM D4814 specifications.

Other Oxygenates: Other aliphatic alcohols and aliphatic ethers intended for motor gasoline blending such as TBA, TAME, ETBE, and Methanol.

PAD (Petroleum Administration for Defense) District. Originally defined during World War II for purposes of administering oil allocation, the five divisions (and three subdivisions) include the 50 States and the District of Columbia.

PAD District I:

PAD District IA:

Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont.

PAD District IB:

Delaware, District of Columbia, Maryland, New Jersey, New York, and Pennsylvania.

PAD District IC:

Florida, Georgia, North Carolina, South Carolina, Virginia, and West Virginia.

PAD District II:

Illinois, Indiana, Iowa, Kansas, Kentucky, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Tennessee, and Wisconsin.

PAD District III:

Alabama, Arkansas, Louisiana, Mississippi, New Mexico, and Texas.

PAD District IV:

Colorado, Idaho, Montana, Utah, and Wyoming.

PAD District V:

Alaska, Arizona, California, Hawaii, Nevada, Oregon, and Washington.

Percent Utilization. Represents the utilization of all crude oil distillation units. The rate is calculated by dividing gross inputs to these units by the operating/operable refining capacity of the unit.

Operable Capacity: The amount of capacity that, at the beginning of the period, is in operation; not in operation and not under active repair, but capable of being placed in operation within 30 days; or not in operation but under active repair that can be completed within 90 days. Operable capacity is the sum of the operating and idle capacity and is measured in barrels per calendar day or barrels per stream day.

Operating Capacity: The component of operable capacity that is in operation at the beginning of the period.

Petroleum Products. Petroleum products are obtained from the processing of crude oil (including lease condensate), natural gas, and other hydrocarbon compounds. Petroleum products include unfinished oils, liquefied petroleum gases, pentanes plus, aviation gasoline, motor gasoline, naphtha-type jet fuel, kerosene-type jet fuel, kerosene, distillate fuel oil, residual fuel oil, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt, road oil, still gas, and miscellaneous products.

Pipeline (Petroleum). Interstate, intrastate, and intracompany pipelines used to transport crude oil and petroleum products within the 50 States and the District of Columbia.

Population-Weighted Degree-Days. Heating or Cooling degree-days weighted by the population of the area in which the degree-days are recorded. To compute the national population-weighted degree-days, the Nation is divided into nine Census regions, comprised of from three to eight States, which are assigned weights based on the ratio of the population of the region to the total population of the Nation. Degree-day readings for each region are multiplied by the corresponding population weight for each region and these products are then summed to arrive at the national population-weighted degree-day figure.

Processing Gain. The volumetric amount by which total output is greater than input for a given period of time. This difference is due to the processing of crude oil into products which, in total, have a lower specific gravity than the crude oil processed.

Product Supplied and Losses, Crude Oil. Crude oil used directly as fuel by refineries and pipelines, and losses due to spills, contamination, fires, etc. as opposed to processing losses at refineries in their operations.

Production. See Net Production.

Products Supplied. A value calculated for specific products which is equal to domestic production plus net imports (imports less exports), less the net increase in primary stocks. Total products supplied is calculated as inputs to refineries, plus estimated refinery gains, plus other hydrocarbon input, plus product imports, less product exports, less the net increase (or decrease) in product stocks. Values shown for "Other Oils" product supplied are the difference between Total Products Supplied and product supplied values for specified products.

Propane (C₃H₈). A normally gaseous straight-chain hydrocarbon. It is a colorless paraffinic gas that boils at a temperature of -43.67 degrees F. It is extracted from natural gas or refinery gas streams. It includes all products designated in ASTM Specification D1835 and Gas Processors Association Specifications for commercial propane and HD-05 propane. *For price data*, it does not include the propane portion of any natural gas liquids (NGL) mixes; i.e., butane-propane and ethane-propane mix.

Propylene (C₃H₆) (nonfuel use). Propylene intended for use in nonfuel applications such as petrochemical manufacturing. Includes chemical-grade propylene, polymer-grade propylene,

and trace amounts of propane. Also includes the propylene component of propane/propylene mixes where the propylene will be separated from the mix in a propane/propylene splitting process. Excludes the propylene component of propane/propylene mixes where the propylene component of the mix is intended for sale into the fuel market.

RBOB. "Reformulated Gasoline Blendstock for Oxygenate Blending" is a motor gasoline blending component which, when blended with a specified type and percentage of oxygenate, meets the definition of reformulated gasoline.

Refiner Acquisition Cost of Crude Oil. The average price paid by refiners for crude oil booked into their refineries in accordance with accounting procedures generally accepted and consistently and historically applied by refiners. Domestic crude oil is that oil produced in the United States or from the outer continental shelf as defined in 43 USC 1131. Imported crude oil is any crude oil that is not domestic oil. The composite is the weighted average price of domestic and imported crude oil. Prices do not include the price of crude oil for the SPR.

Refinery. An installation that manufactures finished petroleum products from crude oil, unfinished oils, natural gas liquids, other hydrocarbons, and oxygenates.

Reformulated Area. See Motor Gasoline (Finished).

Reformulated Gasoline. See Motor Gasoline (Finished).

Residential. Sales of No. 2 distillate and propane to individual customers or households (as opposed to businesses or institutions) who ostensibly use the fuel in a residence for space heating, cooking, etc. Sales to apartment buildings/complexes or to other multi-family dwellings are excluded from the "Residential Sales" category and are included in the "Commercial/Institutional Sales" category. Additional end-use sales category data are available in the *Petroleum Marketing Monthly*.

Residential Heating Oil Price. The price charged for home delivery of No.2 heating oil, exclusive of any discounts such as those for prompt cash payment. Prices do not include taxes paid by the consumer.

Residential Propane Price. The price charged for home delivery of consumer grade propane intended for use in space heating, cooking, or hot water heaters in residences.

Residual Fuel Oil. The heavier oils that remain after the distillate fuel oils and lighter hydrocarbons are distilled away in refinery operations and that conform to ASTM Specification D396. Included are a No. 5, a residual fuel oil of medium viscosity; Navy Special fuel oil as defined in Military Specification MIL-F-859E including Amendment 2 (NATO Symbol F-77), for use in steam-powered vessels in government service and in shore power plants; No. 6, which includes Bunker C fuel oil and is used for commercial and industrial heating, the production of electric power, vessel bunkering, and various industrial purposes. *For supply data*, imports of residual fuel oil include imported crude oil burned as fuel. *For price data*, imported crude oil burned as fuel is excluded.

Retail. Sales made directly to the consumer of a product.

Retail Outlet. Any company-owned outlet (e.g. service station) selling gasoline, on-highway low-sulfur diesel fuel, or propane for on-highway vehicle use which is under the direct control of the firm by virtue of its ability to set the retail product price and directly collect all or part of the retail margin. This category includes retail outlets which are operated by salaried employees of the company and/or its subsidiaries and affiliates, and/or involve personnel services contracted by the firm.

Spot Price. The price for a one-time open market transaction for immediate delivery of a specific quantity of product at a specific location where the commodity is purchased “on the spot” at current market rates.

Brent: A blended crude stream produced in the North Sea region which serves as a reference or “marker” for pricing a number of other crude streams.

Conway: The location specified in either spot or futures contracts for delivery of propane in Conway, Kansas.

Los Angeles: The location specified in either spot or futures contracts for delivery of a product in any port city in southern California.

Mont Belvieu: The location specified in either spot or futures contracts for delivery of propane in Mont Belvieu, Texas.

New York Harbor (NYH): The location specified in either spot or futures contracts for delivery of a product in New York Harbor.

Northwest Europe (NWE): The location specified in either spot or futures contracts for delivery of a product in any port city along the North Sea; however, generally refers to the Amsterdam-Rotterdam-Antwerp refining center.

Rotterdam (ARA): The location specified in either spot or futures contracts for delivery of a product in any port city along the refining centers of Amsterdam-Rotterdam-Antwerp.

Singapore: The location specified in either spot or futures contracts for delivery of a product in Singapore.

US Gulf Coast (GC): The location specified in either spot or futures contracts for delivery of a product in any port city along the coastline of Texas and Louisiana. For supply data, Gulf Coast refers to all 6 PADD III States.

West Texas Intermediate (WTI - Cushing): A crude stream produced in Texas and southern Oklahoma which serves as a reference or “marker” for pricing a number of other crude streams and which is traded in the domestic spot market at Cushing, Oklahoma.

Stocks. For individual products in the WPSR, quantities held at refineries, in pipelines (including storage tanks), and at bulk terminals which have a capacity of 50,000 barrels or more, and all individual products in transit thereto. Stocks held by product

retailers and resellers, as well as tertiary stocks held at the point of consumption are excluded. Stocks held at gas processing plants are excluded from individual product estimates but included in “Other Oils” estimates and “Total”. Stocks are reported as of the end of the reporting period.

Strategic Petroleum Reserve (SPR). Petroleum stocks maintained by the Federal Government for use during periods of major supply interruption.

Sulfur. A yellowish nonmetallic element, sometimes known as “brimstone.” It is present at various levels of concentration in many fossil fuels whose combustion releases sulfur compounds that are considered harmful to the environment. Some of the most commonly used fossil fuels are categorized according to their sulfur content, with lower sulfur fuels usually selling at a higher price. *Note:* No. 2 Distillate fuel is currently reported as having either a 0.05 percent or lower sulfur level for on-highway vehicle use or a greater than 0.05 percent sulfur level for off-highway use, home heating oil, and commercial and industrial uses. Residual fuel, regardless of use, is classified as having either no more than 1 percent sulfur or greater than 1 percent sulfur. Coal is also classified as being low- sulfur at concentrations of 1 percent or less or high-sulfur at concentrations greater than 1 percent.

Unaccounted-for Crude Oil. A term which appears in the U.S. Petroleum Balance Sheet. It reconciles the difference between crude input to refineries and the sum of domestic production, net imports (including SPR), SPR and other stocks withdrawn or added, and product supplied and losses. Its value can be positive or negative since it is a balancing term. Because the unaccounted-for crude oil figure incorporates both estimated and reported values, one would expect the figure to be larger in balances using preliminary or estimated data and smaller in balances using final data. In fact, the published figures confirm this expectation. In the WPSR, 4-week averages for the previous year are interpolated from final monthly data, so that the unaccounted-for crude oil value for the previous year is considerably smaller than that for the current period.

Unfinished Oils. Includes all oils requiring further processing, except those requiring only mechanical blending.

United States. The 50 States and the District of Columbia. *Note:* The United States has varying degrees of jurisdiction over a number of territories and other political entities outside the 50 States and the District of Columbia, including Puerto Rico, the U.S. Virgin Islands, Guam, American Samoa, Johnston Atoll, Midway Islands, Wake Island, and the Northern Mariana Islands. EIA data programs may include data from some or all of these areas in U.S. totals. *Note:* For crude oil prices, the United States includes the 50 States, the District of Columbia, Puerto Rico, the Virgin Islands, and all American Territories and Possessions.

Wholesale. Sales of refined petroleum products to purchasers who are other than ultimate consumers.

Wholesale Price. The rack price charged for No. 2 heating oil or propane; that is, the price paid by customers who purchase No. 2 heating oil or propane free-on-board at a supplier’s terminal and who provide their own transportation for the product(s).
